## Gradient Descent

by If slope = -ve  $\rightarrow \uparrow b$   
 slope = +ve  $\rightarrow \downarrow b$

$$b_{\text{new}} = b_{\text{old}} - \text{slope}$$

$$= b_{\text{old}} - \eta \text{slope}$$

$\downarrow$   
learning rate.

for eg  $\eta = 0.0001$

$$\Rightarrow b_{\text{old}} - 0.0001 m$$

$$\Rightarrow 100 - 2 \times 90$$

$$\Rightarrow 100 - 180$$

$$\Rightarrow \boxed{-80}$$

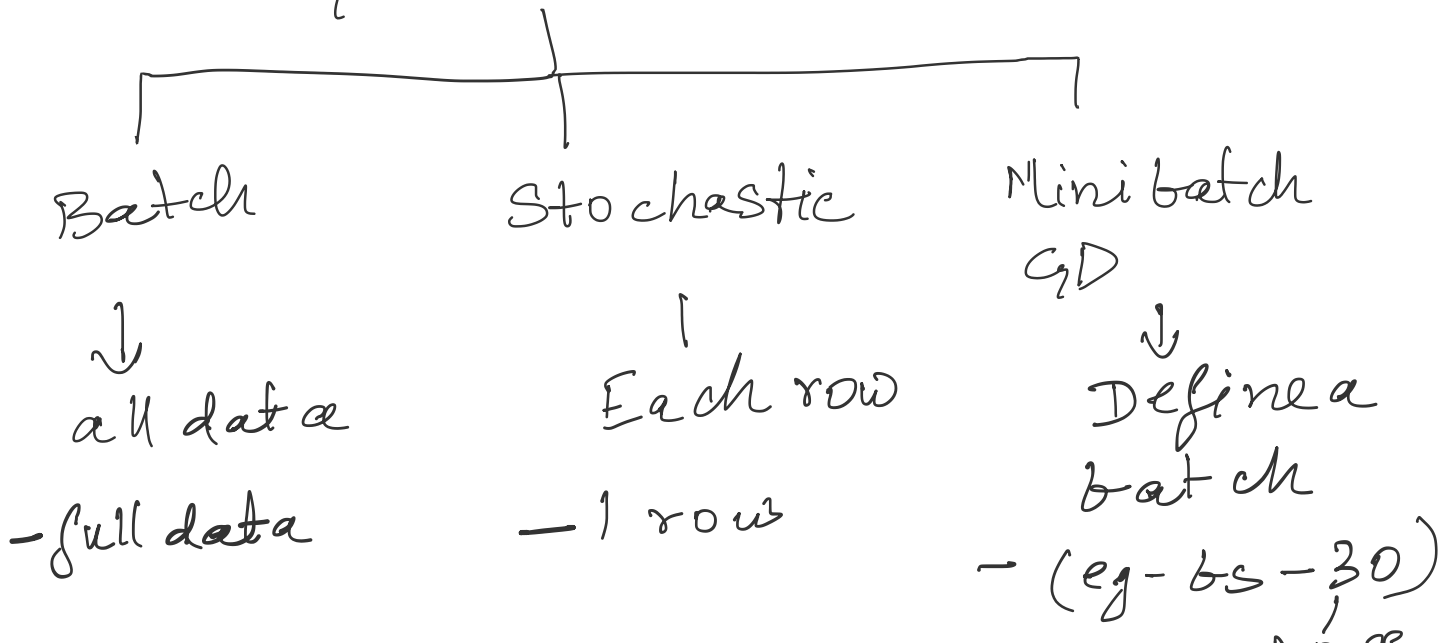

when to stop

1) steps fixed - epochs

2)  $b_{\text{new}} - b_{\text{old}} = 0.0001$

$$L = \sum_{i=1}^n (y_i - \hat{y}_i)^2$$

## Gradient Descent

rows

$$m_n = m_0 - \eta \times (\text{slope})_{m=0}$$

$$m_n = m_0 - \eta \times \left( \frac{\partial L}{\partial m} \right)$$

$$b_n = b_0 - \eta \times (\text{slope})_{b=0}$$

$$b_n = b_0 - \eta \times \left( \frac{\partial L}{\partial b} \right)_{b=0}$$

---

$$\frac{\partial L}{\partial \beta_m} = -\frac{2}{n} \sum_{i=1}^n \underbrace{(x_i - \hat{x}_i)}_{\text{difference}} \underbrace{x_{i,m}}_{\text{feature } x \text{ value}}$$

We have to multiply the difference to the particular feature  $x$  value.
